## 2024\_28\_III\_OOPS Using Java Lab

### 2028\_REC\_OOPS using Java\_Week 3\_Q3

Attempt : 1  
Total Mark : 10  
Marks Obtained : 10

#### Section 1 : Coding

##### 1. Problem Statement

You are developing a warehouse management system for a shipping company. The system uses an integer array to represent the weights of packages in a specific order. To verify that the weight capacity is not exceeded, the program needs to calculate the sum of the weights of the first and last packages in the list.

Task:

Write a code to calculate the sum of the weights of the first and last packages in the list. The program should take an integer array as input and return the total weight of the first and last packages.

##### ***Input Format***

The first line of the input is an integer N representing the size of the array.

The second line of the input is N space-separated integer values.

### **Output Format**

The output is displayed in the following format:

"Sum of the first and last elements: <<Sum>>"

Refer to the sample output for formatting specifications.

### **Sample Test Case**

Input: 5

10 20 30 40 50

Output: Sum of the first and last elements: 60

### **Answer**

// You are using Java

import java.util.\*;

class Main

{

void weight(int n, Scanner s)

{

int[] arr = new int[n];

for(int i = 0; i < n; i++)

{

arr[i] = s.nextInt();

}

int first = arr[0];

int last = arr[n-1];

int sum = first + last;

System.out.println("Sum of the first and last elements: "+sum);

}

public static void main(String[] args)

{

```
Scanner s = new Scanner(System.in);  
    int n = s.nextInt();  
    Main obj = new Main();  
    obj.weight(n,s);  
}  
}
```

**Status :** Correct

**Marks :** 10/10
